

Application-layer Protocols

Kai Shen

10/22/2014

CSC 257/457 - Fall 2014

1

Network Applications and Application-Layer Protocols

Network applications:

- running in end systems (hosts)
- distributed, communicating using network
- use communication services provided by lower layer protocols (TCP, UDP)

Application-layer comm. protocols:

- define comm. interface between application components
- **open protocol** ⇒ components implemented independently can inter-operate

10/22/2014

CSC 257/457 - Fall 2014

2

Web and HTTP

- **Web**: the application for distributed publishing and viewing of content
- Client/server model
 - **server**: hosts publish content and sends the content upon request
 - **client**: requests, receives, and displays content
- **HTTP**: the comm. protocol supporting the web
 - request/response format

10/22/2014

CSC 257/457 - Fall 2014

3

Plain Text Headers

HTTP headers are plain text.
TCP/UDP/IP/Ethernet headers are binary.

Issues:

- Efficiency
- Portability
- Easy for human understanding, debugging

10/22/2014

CSC 257/457 - Fall 2014

4

Performance of HTTP Persistency

TCP per-connection overhead:

- Connection establishment
- Congestion control: slow start

Non-persistent HTTP (1.0)

- At most one object is sent over a TCP connection.
- Pays TCP per-connection overhead for each object.

Persistent HTTP (1.1)

- Multiple objects can be sent over single TCP connection between the browser and web server.

10/22/2014

CSC 257/457 - Fall 2014

5

Additional Example Applications

- Remote console
 - Components: host machine and console client
 - Comm. protocol: SSH
- Electronic mail
 - Components: mail servers and mail readers
 - Comm. protocol: SMTP, POP3, IMAP
- Domain name system (DNS)
- Network file system (NFS)
- Peer-to-peer content sharing (Gnutella, BitTorrent)
-

10/22/2014

CSC 257/457 - Fall 2014

6

Electronic Mail

Two types of components:

- **Mail servers**
 - mailbox contains incoming messages for users
 - message queue of outgoing (to be sent) mail messages
- **User agents**
 - a.k.a. "mail reader"
 - composing, editing, reading mail messages
 - e.g., pine, Outlook, Web browser

10/22/2014

CSC 257/457 - Fall 2014

7

Electronic Mail

Two types of protocols:

- **Mail transfer protocol**
 - from sender agent to the receiver's mail server
 - SMTP (simple mail transfer protocol)
- **Mail access protocol**
 - the receiver pulls mails from server to agent
 - POP, IMAP, proprietary prot.

8

SMTP Interaction between mail servers at cs.rochester.edu (client) and gmail.com (server)

```

S: 220 gmail.com
C: HELO cs.rochester.edu
S: 250 Hello cs.rochester.edu, pleased to meet you
C: MAIL FROM: <alice@cs.rochester.edu>
S: 250 alice@cs.rochester.edu... Sender ok
C: RCPT TO: <bob@gmail.com>
S: 250 bob@gmail.com ... Recipient ok
C: DATA
S: 354 Enter mail, end with "." on a line by itself
C: Do you like ketchup?
C: How about pickles?
C: .
S: 250 Message accepted for delivery
C: QUIT
S: 221 gmail.com closing connection
  
```

10/22/2014

CSC 257/457 - Fall 2014

9

Try SMTP Interaction Yourself

- telnet servername 25
- see 220 reply from server
- enter **HELO**, **MAIL FROM**, **RCPT TO**, **DATA**, **QUIT** cmds

This lets you

- send email without using a normal email client
- ...

10/22/2014

CSC 257/457 - Fall 2014

10

Mail Access Protocols

- SMTP: delivery to receiver's server and stored there
- Mail access protocol: retrieval from server
 - POP3: Post Office Protocol
 - authorization and download
 - IMAP: Internet Mail Access Protocol
 - manipulation of stored messages on server
 - Proprietary: Gmail, Outlook-Exchange, etc.

CSC 257/457 - Fall 2014

11

DNS: Domain Name System

People: multiple identifiers

- SSN – good for machine bookkeeping, indexing
- name – human friendly, easy to remember

Internet hosts:

- IP address - used for addressing, routing on the Internet
- “name”, e.g., cycle1.cs.rochester.edu - human friendly
- Q: map between IP addresses and names?
- **DNS query:** find the IP address for a given name
- not part of Internet as a network
- ease of use for Internet applications
 - “ssh cycle1.cs.rochester.edu” vs. “ssh 128.151.67.99”
 - <http://www.cnn.com> vs. <http://64.236.24.20>

10/22/2014

CSC 257/457 - Fall 2014

12

Domain Name System: Overview

- Distributed database
 - Implemented with collaboration of many name servers distributed all over the network
- DNS queries
 - **Name lookup**: find the IP address for a given name
 - Others: find mail server for a domain, ipv4/v6 address mapping, ...

10/22/2014

CSC 257/457 - Fall 2014

13

DNS: Decentralized and Hierarchical

- Decentralized
 - a large number of servers/sites work together
- Why not centralize DNS?
 - performance bottleneck
 - single point of failure
 - can only be close to few hosts \Rightarrow long latency to many others
- Hierarchical/partitioned
 - there are different types of name servers in charge of different mappings
- What if massively replicating it?
 - **high overhead of maintaining consistency**: hard to make any changes on the data

10/22/2014

CSC 257/457 - Fall 2014

14

Types of Name Servers

- **Local name server** (defined for a particular group of hosts):
 - each organization often has a local (default) name server
 - used when one of the hosts in its domain initiates a DNS query
 - first stop for a DNS query
- **Authoritative name server** (defined for a particular group of hosts):
 - maintain "IP address – name" mapping for a group of hosts so it can answer DNS query for these hosts
 - used when one of the hosts in its domain is the target of a DNS query
 - last stop for a DNS query (if ever reached)
 - often the same as local name server for an organization
- Each local NS may not know all authoritative NSes
 - something is missing ...

10/22/2014

CSC 257/457 - Fall 2014

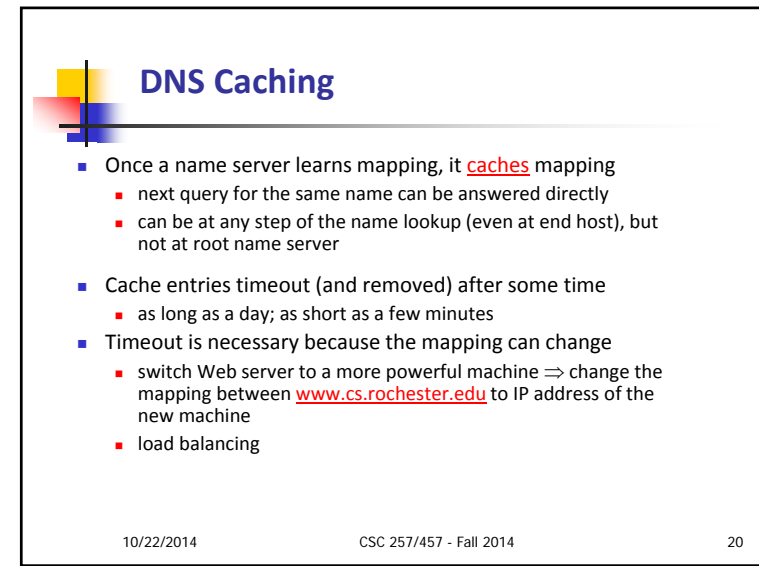

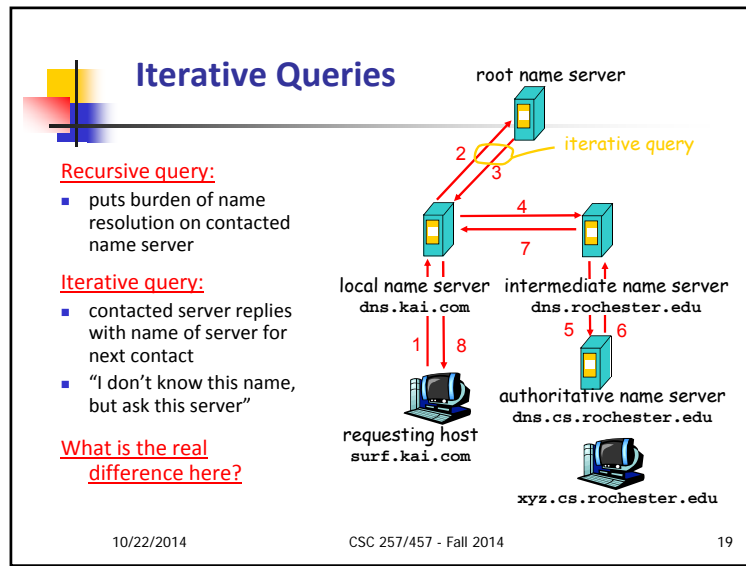

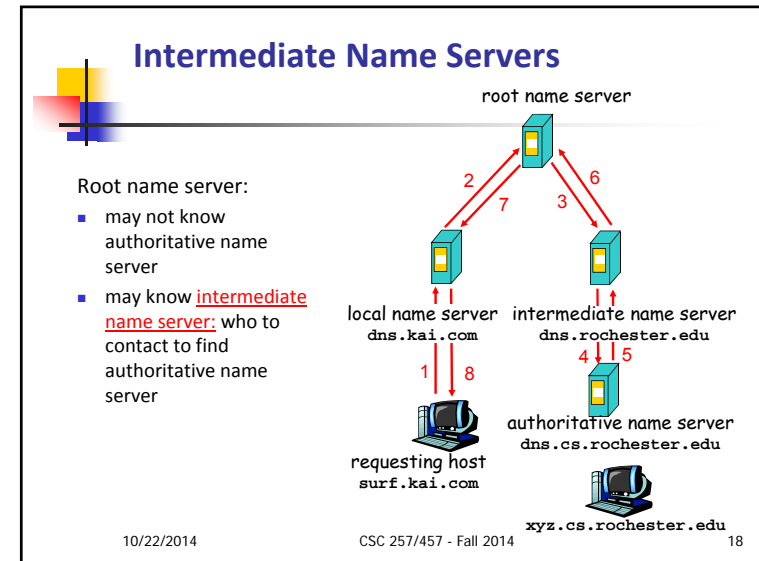

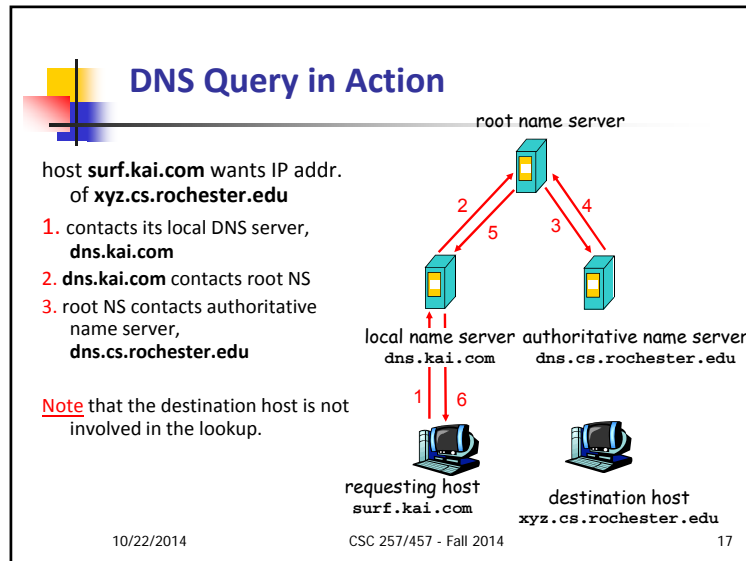

15

Root Name Servers

- **Root name server** (defined globally)
 - bridging between local NSs and authoritative NSes
 - contacted by local name server that cannot resolve name
- What it does:
 - contacts authoritative name server
 - gets result and returns it to the requesting local name server

16

DNS Properties

- Scalability
 - poor scalability at the few root name servers
 - made more scalable by iterative queries and caching
- Reliability
 - problems at (even a single) root name server(s) can cause big problem
 - again, caching helps improve reliability
- Consistency
 - DNS caching is replication without consistency guarantee
 - only feasible for stable name-IP address mapping, may not be suitable for more dynamic information

10/22/2014

CSC 257/457 - Fall 2014

21

TCP vs. UDP

- We saw applications:
 - Web/HTTP
 - Email/SMTP/POP3/IMAP
 - DNS
- They build on some transport services.
 - TCP or UDP?
