

CSC 252: Computer Organization

Spring 2021: Lecture 3

Instructor: Yuhao Zhu

Department of Computer Science
University of Rochester

Announcement

- Programming Assignment 1 is out
 - Details: <https://www.cs.rochester.edu/courses/252/spring2021/labs/assignment1.html>
 - Due on Feb. 17, 11:59 PM
 - You have 3 slip days

7	8	9 Today	10	11	12	13
14	15	16	17 Due	18	19	20

Announcement

- Programming assignment 1 is in C language. Seek help from TAs.
- TAs are best positioned to answer your questions about programming assignments!!!
- Programming assignments do NOT repeat the lecture materials. They ask you to synthesize what you have learned from the lectures and work out something new.

Encoding Negative Numbers

1	001
2	010
3	011
-4	100
-3	101
-2	110
-1	111

- 3 + 1 becomes -4 (called **overflow**. More on it later.)

Data Types (in C)

- Suppose you want to define a variable that represents a person's age. What assumptions can you make about this variable's numerical value?

Data Types (in C)

- Suppose you want to define a variable that represents a person's age. What assumptions can you make about this variable's numerical value?
 - Integer

Data Types (in C)

- Suppose you want to define a variable that represents a person's age. What assumptions can you make about this variable's numerical value?
 - Integer
 - Non-negative

Data Types (in C)

- Suppose you want to define a variable that represents a person's age. What assumptions can you make about this variable's numerical value?
 - Integer
 - Non-negative
 - Between 0 and 255 (8 bits)

Data Types (in C)

- Suppose you want to define a variable that represents a person's age. What assumptions can you make about this variable's numerical value?
 - Integer
 - Non-negative
 - Between 0 and 255 (8 bits)
- Define a data type that captures all these attributes:
`unsigned char` in C

Data Types (in C)

- Suppose you want to define a variable that represents a person's age. What assumptions can you make about this variable's numerical value?
 - Integer
 - Non-negative
 - Between 0 and 255 (8 bits)
- Define a data type that captures all these attributes:
`unsigned char` in C
 - Internally, an **unsigned char** variable is represented as a 8-bit, non-negative, binary number

Data Types (in C)

- What if you want to define a variable that could take negative values?

Data Types (in C)

- What if you want to define a variable that could take negative values?
 - That's what signed data types (e.g., **int**, **short**, etc.) are for

Data Types (in C)

- What if you want to define a variable that could take negative values?
 - That's what signed data types (e.g., **int**, **short**, etc.) are for
- How are `int` values internally represented?

Data Types (in C)

- What if you want to define a variable that could take negative values?
 - That's what signed data types (e.g., **int**, **short**, etc.) are for
- How are `int` values internally represented?
 - Theoretically could be either signed-magnitude or two's complement

Data Types (in C)

- What if you want to define a variable that could take negative values?
 - That's what signed data types (e.g., **int**, **short**, etc.) are for
- How are `int` values internally represented?
 - Theoretically could be either signed-magnitude or two's complement
 - The C language designers chose two's complement

Data Types (in C)

- What if you want to define a variable that could take negative values?
 - That's what signed data types (e.g., **int**, **short**, etc.) are for
- How are `int` values internally represented?
 - Theoretically could be either signed-magnitude or two's complement
 - The C language designers chose two's complement

```
int x = -5, y = 4;
int z = x + y;
fprintf(stdout, "%d\n", z);
fprintf(stdout, "%u\n", z);
```

Data Types (in C)

C Data Type	32-bit	64-bit

- C Language
 - `#include <limits.h>`
 - Declares constants, e.g.,
 - `ULONG_MAX`
 - `LONG_MAX`
 - `LONG_MIN`
 - Values platform specific

Can We Represent Fractions in Binary?

- What does 10.01_2 mean?
- C.f., Decimal
 - $12.45 = 1*10^1 + 2*10^0 + 4*10^{-1} + 5*10^{-2}$
- $10.01_2 = 1*2^1 + 0*2^0 + 0*2^{-1} + 1*2^{-2} = 2.25_{10}$

Can We Represent Fractions in Binary?

- What does 10.01_2 mean?
- C.f., Decimal
 - $12.45 = 1 \cdot 10^1 + 2 \cdot 10^0 + 4 \cdot 10^{-1} + 5 \cdot 10^{-2}$
- $10.01_2 = 1 \cdot 2^1 + 0 \cdot 2^0 + 0 \cdot 2^{-1} + 1 \cdot 2^{-2} = 2.25_{10}$

Today: Representing Information in Binary

- Why Binary (bits)?
- Bit-level manipulations
- **Integers**
 - Representation: unsigned and signed
 - **Conversion, casting**
 - Expanding, truncating
 - Addition, negation, multiplication, shifting
 - Summary
- Representations in memory, pointers, strings

One Bit Sequence, Two Interpretations

- A sequence of bits can be interpreted as either a signed integer or an unsigned integer

Signed	Unsigned	Binary
0	0	000
1	1	001
2	2	010
3	3	011
-4	4	100
-3	5	101
-2	6	110
-1	7	111

Signed vs. Unsigned Conversion in C

- What happens when we convert between signed and unsigned numbers?
- Casting (In C terminology)
 - Explicit casting between signed & unsigned

```
int tx, ty = -4;
unsigned ux = 7, uy;
tx = (int) ux; // U2T
uy = (unsigned) ty; // T2U
```

- Implicit casting
 - e.g., assignments, function calls
- ```
tx = ux;
uy = ty;
```

# Mapping Between Signed & Unsigned

- Mappings between unsigned and two's complement numbers: **Keep bit representations and reinterpret**

# Mapping Between Signed & Unsigned

- Mappings between unsigned and two's complement numbers: **Keep bit representations and reinterpret**

# Today: Representing Information in Binary

- Why Binary (bits)?
- Bit-level manipulations
- **Integers**
  - Representation: unsigned and signed
  - Conversion, casting
  - **Expanding, truncating**
  - Addition, negation, multiplication, shifting
  - Summary
- Representations in memory, pointers, strings

# The Problem

```
short int x = 15213;
int ix = (int) x;
short int y = -15213;
int iy = (int) y;
```

| C Data Type | 64-bit |
|-------------|--------|
| char        | 1      |
| short       | 2      |
| int         | 4      |
| long        | 8      |

# The Problem

```
short int x = 15213;
int ix = (int) x;
short int y = -15213;
int iy = (int) y;
```

- Converting from smaller to larger integer data type
- Should we preserve the value?
- Can we preserve the value?
- How?

# Signed Extension

- Task:
  - Given  $w$ -bit signed integer  $x$
  - Convert it to  $(w+k)$ -bit integer with same value

# Signed Extension

- Task:

- Given  $w$ -bit signed integer  $x$
- Convert it to  $(w+k)$ -bit integer with same value

- Rule:

- Make  $k$  copies of sign bit:
- $X' = \underbrace{X_{w-1}, \dots, X_{w-1}}_{k \text{ copies of MSB}}, X_{w-1}, X_{w-2}, \dots, X_0$

$k$  copies of MSB

# Signed Extension

- Task:

- Given  $w$ -bit signed integer  $x$
- Convert it to  $(w+k)$ -bit integer with same value

- Rule:

- Make  $k$  copies of sign bit:
- $X' = \underbrace{x_{w-1}, \dots, x_{w-1}}_{k \text{ copies of MSB}}, x_{w-1}, x_{w-2}, \dots, x_0$

# Another Problem

```
unsigned short x = 47981;
unsigned int ux = x;
```

- Truncating (e.g., int to short)
  - C's implementation: leading bits are truncated, results reinterpreted
  - So can't always preserve the numerical value

# Today: Representing Information in Binary
