What does this Python program do?

```python
for i in range(n):
    print("boom!")
```
Strategy: Run (or Interpret) the program

- Running the program and observing what it does is a perfectly reasonable way of analyzing a program
  - Maybe run it in a simulator/VM or interpreter
- What problems do you anticipate with this strategy?
Some potential problems

- Too long
- Infinite loop (aka non-termination)
- Number of inputs may be infinite!
  - Behaviour may depend on input
What does this program do?

```python
def collatz(n):  # n is a positive integer
    while n > 1:
        print(n)
        if n % 2 == 0:
            n = n // 2  # integer division
        else:
            n = 3 * n + 1
    for i in range(n):
        print("boom!")
```
Some runs: \( n=5 \)

5  
16  
8  
4  
2  
1  

boom!
Some runs: \(n=12\)

12
6
3
10
5
16
8
4
2
1
boom!
Analyzing this program

- This program will print only 1 boom!
- If the loop terminates
  - Only if \( n \) is always reduced to 1
  - Is it always? ($500 reward!)
- Can we determine if the loop terminates?
  - For any \( n \)?
  - For a fixed \( n \)?
In general, an algorithm cannot determine if a program will terminate on a given input.

What does this imply for program analysis?

End of this course?
Program Analysis

- Program analysis needed for optimization ("making programs faster")
  - Reducing number of operations
  - Substituting cheaper operations
  - Increasing parallelism of operations
- Also need for verification ("security")
  - Will this program crash for any input?
  - Will this program leak memory? (malloc but no corresponding free)
  - Will this program read another user’s files?
  - Can a program be subverted to obtain root access?
- Computers everywhere, such questions far more important now!
  - 4.4B people have smartphones!
Mission Impossible?

- No general technique to analyze programs
  - Many different approaches
- We will study many of these
  - Basic
  - Advanced
  - Recent advances
Some things program analysis makes possible

- Fast Javascript
  - pioneered by Google’s V8
- Safe in-kernel execution of user-provided code
  - Linux eBPF
  - pioneered by Sun’s DTrace
- Safe systems programming languages
  - Rust
- Airplanes in the sky

People

- **Instructor**: Dr. Sreepathi Pai
  - E-mail: sree@cs.rochester.edu
  - Office: Wegmans 3409
  - Office Hours: By appointment, but I have an open door policy (10AM–3PM)

- **TAs:**
  - Alan Chiu
  - Chi Chun Chen
Places

- Class: Hylan 202
  - M, W 1025–1140
- Course Website
- Blackboard
  - Announcements, Assignments, etc.
- Piazza
  - ?
References

▶ Four textbooks
  ▶ Cooper and Torczon, *Engineering a Compiler*
  ▶ Aho, Lam, Ullman, Sethi, *Compilers: Principles, Techniques and Tools*
  ▶ Allen and Kennedy, *Optimizing Compilers for Modern Architectures*
  ▶ Muchnick, *Advanced Compiler Design and Implementation*
  ▶ Research Papers

▶ This course requires a lot of reading!
  ▶ Books and materials have been placed on reserve
  ▶ Some online, some in Carlson Library

▶ See Blackboard for information on accessing Reserves
Grading

- Homeworks: 20%
- Assignments: 55% (4)
- Exams: 25% (midterm + final)
- Graduate students should expect to read a lot more, and work on harder problems.

There is no fixed grading curve.
See course website for late submissions policy.
Academic Honesty

▶ Unless explicitly allowed, you may not show your code to other students
▶ You may discuss, brainstorm, etc. with your fellow students but all submitted work must be your own
▶ All help received must be acknowledged in writing when submitting your assignments and homeworks
▶ All external code you use must be clearly marked as such in your submission
    ▶ Use a comment and provide URL if appropriate
▶ If in doubt, ask the instructor

All violations of academic honesty will be dealt with strictly as per UR’s Academic Honesty Policy.
