

Recap

- C Control
 - if-then-else
 - do-while
 - while, for
 - switch
- Assembler Control
 - Conditional jump
 - Conditional move
 - Indirect jump (via jump tables)
 - Compiler generates code sequence to implement more complex control
- Standard Techniques
 - Loops converted to do-while or jump-to-middle form
 - Large switch statements use jump tables
 - Allows k-way branch in $O(1)$ operations
 - Sparse switch statements may use decision trees (if-elseif-elseif-else)

115

Conditions from Condition Codes

- When is condition ge true (jge, setge)?
 - Overflow: $a \geq 0, b < 0; SF = 1$
 - No overflow:
 - $a \geq 0, b < 0; SF = 0$
 - $a \geq 0, b \geq 0; SF = 0$
 - $a < 0, b < 0; SF = 0$
 - $OF.SF + \sim OF. \sim SF = \sim (OF \wedge SF)$

117

Mechanisms in Procedures

- Passing control
 - To beginning of procedure code
 - Back to return point
- Passing data
 - Procedure arguments
 - Return value
- Memory management
 - Allocate during procedure execution
 - Deallocate upon return
- Mechanisms all implemented with machine instructions
- x86-64 implementation of a procedure uses only those mechanisms required

118

x86-64 Stack

- Region of memory managed with stack discipline
- Grows toward lower addresses
- Register `%rsp` contains lowest stack address
 - address of “top” element

Stack Pointer: `%rsp` →

119

x86-64 Stack: Push

- `pushq Src`
 - Fetch operand at `Src`
 - Decrement `%rsp` by 8
 - Write operand at address given by `%rsp`

Stack Pointer: `%rsp` →

120

x86-64 Stack: Pop

- `popq Dest`
 - Read value at address given by `%rsp`
 - Increment `%rsp` by 8
 - Store value at `Dest` (must be register)

Stack Pointer: `%rsp` →

122

Code Examples

```
void multstore
(long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

```
0000000000400540 <multstore>:
400540: push    %rbx          # Save %rbx
400541: mov     %rdx,%rbx      # Save dest
400544: callq   400550 <mult2> # mult2(x,y)
400549: mov     %rax,(%rbx)     # Save at dest
40054c: pop     %rbx          # Restore %rbx
40054d: retq
```

```
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
0000000000400550 <mult2>:
400550: mov     %rdi,%rax      # a
400553: imul    %rsi,%rax      # a * b
400557: retq    # Return
```

123

Procedure Control Flow

- Use stack to support procedure call and return
- **Procedure call:** `call label`
 - Push return address on stack
 - Jump to *label*
- Return address:
 - Address of the next instruction right after call
 - Example from disassembly
- **Procedure return:** `ret`
 - Pop address from stack
 - Jump to address

124

Control Flow Example #1

```
0000000000400540 <multstore>:
.
.
400544: callq   400550 <mult2>
400549: mov     %rax,(%rbx)
.
.
```

```
0000000000400550 <mult2>:
400550: mov     %rdi,%rax
.
.
400557: retq
```

Procedure Data Flow

Registers

- First 6 arguments

%rdi
%rsi
%rdx
%rcx
%r8
%r9
- Return value

%rax

Stack

...
Arg n
...
Arg 8
Arg 7

- Only allocate stack space when needed

130

Data Flow Examples

```
void multstore
(long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

```
0000000000400540 <multstore>:
# x in %rdi, y in %rsi, dest in %rdx
...
400541: mov    %rdx,%rbx    # Save dest
400544: callq  400550 <mult2> # mult2(x,y)
# t in %rax
400549: mov    %rax, (%rbx)  # Save at dest
...
```

```
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
0000000000400550 <mult2>:
# a in %rdi, b in %rsi
400550: mov    %rdi,%rax    # a
400553: imul   %rsi,%rax    # a * b
# s in %rax
400557: retq               # Return
```

132

Stack-Based Languages

- Languages that support recursion
 - e.g., C, Pascal, Java
 - Code must be “*Reentrant*”
 - Multiple simultaneous instantiations of single procedure
 - Need some place to store state of each instantiation
 - Arguments
 - Local variables
 - Return pointer
- Stack discipline
 - State for given procedure needed for limited time
 - From when called to when return
 - Callee returns before caller does
- Stack allocated in **Frames**
 - state for single procedure instantiation

133

Call Chain Example

```
yoo (...)\n{\n    .\n    .\n    who ();\n    .\n    .\n}
```

```
who (...)\n{\n    . . .\n    amI ();\n    . . .\n    amI ();\n    . . .\n}
```

```
amI (...)\n{\n    .\n    .\n    amI ();\n    .\n    .\n}
```

Procedure amI () is recursive

Example
Call Chain

134

Stack Frames

- Contents
 - Return information
 - Local storage (if needed)
 - Temporary space (if needed)
- Management
 - Space allocated when enter procedure
 - “Set-up” code
 - Includes push by `call` instruction
 - Deallocated when return
 - “Finish” code
 - Includes pop by `ret` instruction

Frame Pointer: `%rbp`
(Optional)

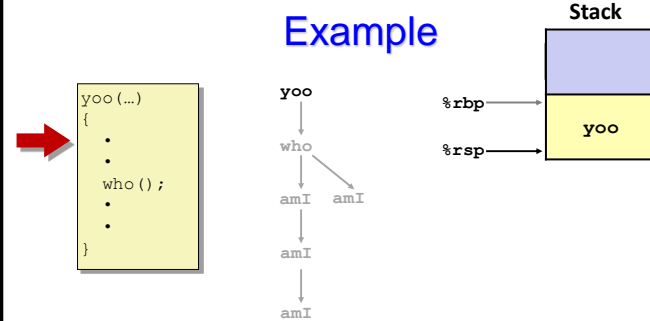

Stack Pointer: `%rsp`

Stack “Top”

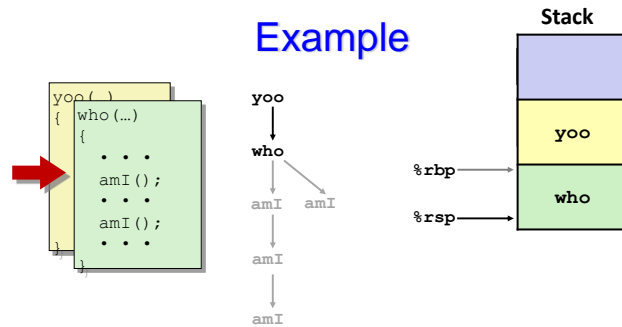

135

Example

146

x86-64/Linux Stack Frame

- Current Stack Frame ("Top" to Bottom)
 - "Argument build:"
Parameters for function about to call
 - Local variables
If can't keep in registers
 - Saved register context
 - Old frame pointer (optional)

- Caller Stack Frame
 - Return address
 - Pushed by `call` instruction
 - Arguments for this call

Example: `incr`

```
long incr(long *p, long val) {
    long x = *p;
    long y = x + val;
    *p = y;
    return x;
}
```

```
incr:
    movq    (%rdi), %rax
    addq    %rax, %rsi
    movq    %rsi, (%rdi)
    ret
```

Register	Use(s)
%rdi	Argument <code>p</code>
%rsi	Argument <code>val</code> , <code>y</code>
%rax	<code>x</code> , Return value

147

148

Example: Calling `incr` #1

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Initial Stack Structure

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Resulting Stack Structure

149

Example: Calling `incr` #2

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Stack Structure

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
%rdi	<code>&v1</code>
%rsi	<code>3000</code>

150

Example: Calling `incr` #3

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Stack Structure

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	3000

151

Example: Calling `incr` #4

Stack Structure

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
<code>%rax</code>	Return value

Updated Stack Structure

152

Example: Calling `incr` #5

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Updated Stack Structure

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
<code>%rax</code>	Return value

Final Stack Structure

153

Register Saving Conventions

- When procedure `yoo` calls `who`:
 - `yoo` is the *caller*
 - `who` is the *callee*
- Can register be used for temporary storage?

```
yoo:
    . . .
    movq    $15213, %rdx
    call    who
    addq    %rdx, %rax
    . . .
    ret
```

```
who:
    . . .
    subq    $18213, %rdx
    . . .
    ret
```

- Contents of register `%rdx` overwritten by `who`
- This could be trouble → something should be done!
 - Need some coordination

154

Register Saving Conventions

- When procedure **you** calls **who**:
 - you** is the **caller**
 - who** is the **callee**
- Can register be used for temporary storage?
- Conventions
 - "Caller Saved"**
 - Caller saves temporary values in its frame before the call
 - "Callee Saved"**
 - Callee saves temporary values in its frame before using

155

x86-64 Linux Register Usage #1

- %rax**
 - Return value
 - Also caller-saved
 - Can be modified by procedure
- %rdi, ..., %r9**
 - Arguments
 - Also caller-saved
 - Can be modified by procedure
- %r10, %r11**
 - Caller-saved
 - Can be modified by procedure

156

x86-64 Linux Register Usage #2

- %rbx, %r12, %r13, %r14**
 - Callee-saved
 - Callee must save & restore
- %rbp**
 - Callee-saved
 - Callee must save & restore
 - May be used as frame pointer
 - Can mix & match
- %rsp**
 - Special form of callee save
 - Restored to original value upon exit from procedure

157

Callee-Saved Example #1

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq    %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

Initial Stack Structure

Resulting Stack Structure

158

Callee-Saved Example #2

Resulting Stack Structure

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq    %rbx
    subq     $16, %rsp
    movq     %rdi, %rbx
    movq     $15213, 8(%rsp)
    movl     $3000, %esi
    leaq     8(%rsp), %rdi
    call     incr
    addq     %rbx, %rax
    addq     $16, %rsp
    popq     %rbx
    ret
```

160

Recursive Function

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl     $0, %eax
    testq    %rdi, %rdi
    je       .L6
    pushq    %rbx
    movq     %rdi, %rbx
    andl     $1, %ebx
    shrq     %rdi # (by 1)
    call     pcount_r
    addq     %rbx, %rax
    popq     %rbx
.L6:
    rep; ret
```

161

Recursive Function Terminal Case

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl     $0, %eax
    testq    %rdi, %rdi
    je       .L6
    pushq    %rbx
    movq     %rdi, %rbx
    andl     $1, %ebx
    shrq     %rdi # (by 1)
    call     pcount_r
    addq     %rbx, %rax
    popq     %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type

.L6:
    rep; ret
```

Register	Use(s)	Type
%rbx	x & 1	Callee-saved
%rax	Recursive call return value	

165

Recursive Function Result

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi # (by 1)
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rbx	x & 1	Callee-saved
%rax	Return value	

166

Recursive Function Completion

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi # (by 1)
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rax	Return value	Return value

167

Observations About Recursion

- Handled Without Special Consideration
 - Stack frames mean that each function call has private storage
 - Saved registers & local variables
 - Saved return pointer
 - Register saving conventions prevent one function call from corrupting another's data
 - Unless the C code explicitly does so (e.g., buffer overflow in Lecture 9)
 - Stack discipline follows call / return pattern
 - If P calls Q, then Q returns before P
 - Last-In, First-Out
- Also works for mutual recursion
 - P calls Q; Q calls P

168

x86-64 Procedure Summary

- Important Points
 - Stack is the right data structure for procedure call / return
 - If P calls Q, then Q returns before P
- Recursion (& mutual recursion) handled by normal calling conventions
 - Can safely store values in local stack frame and in callee-saved registers
 - Put function arguments at top of stack
 - Result return in %rax
- Pointers are addresses of values
 - On stack or global

169

170

170

Instruction Set Architecture

- Assembly Language View
 - Processor state
 - Registers, memory, ...
 - Instructions
 - `addl, movl, leal, ...`
 - How instructions are encoded as bytes
- Layer of Abstraction
 - Above: how to program machine
 - Processor executes instructions in a sequence
 - Below: what needs to be built
 - Use variety of tricks to make it run fast
 - E.g., execute multiple instructions simultaneously

9/23/2020

171

171

Basic Issues in Instruction Set Design

Goal: find a language that makes it easy to build both the hardware and the compiler while maximizing performance and minimizing cost

- What operations (and how many) should be provided
- How (and how many) operands are specified
- What data types and sizes
- How to encode these into consistent instruction formats

9/23/2020

172

172

Instruction Format

- Can be
 - fixed length – simpler decoding
 - variable length – higher code density/smaller program
 - Large instruction word (encoding multiple instructions and dependences among those instructions)
- If we have many memory operands per instruction and many addressing modes, we need an address specifier per operand/result
- If we have a load-store architecture with 1 address per instruction and one or two addressing modes, we can encode the addressing mode in the opcode

9/23/2020

173

173

CISC Instruction Sets

- Complex Instruction Set Computer
- Dominant style through mid-80's
- Philosophy
 - Add instructions to perform "typical" programming tasks
- Variable length encodings
- Variable execution times
- Multiple formats for specifying operands
- Implementation artifacts hidden from machine-level programs
- Stack-oriented instruction set
 - Use stack to pass arguments, save program counter
 - Explicit push and pop instructions
- Any instruction can access memory
 - `addl %eax, 12(%ebx, %ecx, 4)`
 - requires memory read and write
 - Complex address calculation
- Condition codes
 - Set as side effect of arithmetic and logical instructions

RISC Instruction Sets

- Reduced Instruction Set Computer
- Internal project at IBM, later popularized by Hennessy (Stanford) and Patterson (Berkeley)
- Fewer, simpler instructions
 - Might take more to get given task done
 - Can execute them with small and fast hardware
- Fixed length encoding
- Simple addressing formats (typically just base+displacement)
- Register-oriented instruction set
 - Many more (typically 32) registers
 - Use for arguments, return pointer, temporaries
- Only load and store instructions can access memory
- No Condition codes - test instructions return 0/1 in register
- Implementation artifacts exposed to machine-level programs

CISC vs. RISC

- Original Debate
 - Strong opinions!
 - CISC proponents---easy for compiler, fewer code bytes
 - RISC proponents---better for optimizing compilers, can make run fast with simple chip design
- Current Status
 - For desktop processors, choice of ISA not a technical issue
 - With enough hardware, can make anything run fast
 - Code compatibility more important
 - For embedded processors, RISC makes sense
 - Smaller, cheaper, less power
